Executive Summary

In the fall of 2001, nearly 1.2 million freshmen began college at a four-year institution of higher education somewhere in the United States. Nearly all of them expected to earn a bachelor's degree. As a rule, college students do not pack their belongings into the back of a minivan in early September wondering *if* they will get a diploma—only *when*.

For many students, however, that confidence was misplaced. At a time when college degrees are valuable—with employers paying a premium for college graduates—fewer than 60 percent of new students graduated from four-year colleges within six years. At many institutions, graduation rates are far worse. Graduation rates may be of limited import to students attending the couple hundred elite, specialized institutions that dominate the popular imagination, but there are vast disparities—even *among schools educating similar students*—at the less selective institutions that educate the bulk of America's college students. At a time when President Barack Obama is proposing vast new investments to promote college attendance and completion, and has announced an intention to see the United States regain leadership in such tallies, these results take on heightened significance.

This report documents the dramatic variation in graduation rates across more than 1,300 of the nation's colleges and universities, even between those with similar admissions criteria and students. Using official U.S. Department of Education graduation rates, this report identifies the top and bottom performers among institutions that have similar levels of admissions selectivity, as reported in the widely used *Barron's Profiles of American Colleges*. Though completion rates increase as one moves up the selectivity scale, we show that within each category of selectivity,

there are large differences between the schools that graduate most students and those that graduate few. While student motivation, intent, and ability matter greatly when it comes to college completion, our analysis suggests that the practices of higher education institutions matter, too.

The institutions covered in this report run the gamut from large, public research universities to small, private liberal arts colleges; from highly selective, world-famous institutions to regional, open admissions ones. America's college graduation rate crisis is not happening at the handful of institutions that admit only a few of their applicants and graduate most—it is happening at a large swath of institutions that admit many but graduate few.

We do not argue that high graduation rates are invariably a good sign or low graduation rates necessarily a bad one. After all, an easy way to pad graduation rates is to drop standards and hand a diploma to every student who walks through the door. And we do not want to suggest that modest differences in graduation rates should be overemphasized—that is why we focus on the extremes.

However, graduation rates as calculated here do convey important information—information that should be readily available to students selecting a school, parents investing in their child's education, and policymakers and taxpayers who finance student aid and public institutions. We believe that the graduation rate measure included here should be just the beginning of a deeper inquiry into college success—one driven by more accurate measures broadly defined: in future earnings, in acquiring knowledge, in workplace success, and ultimately in becoming the kind of citizens who can contribute to the stability and prosperity of our society.

Introduction

In the fall of 2001, nearly 1.2 million freshmen began college at a four-year institution of higher education somewhere in the United States. Nearly all of them, it is safe to say, expected to earn a bachelor's degree. As a rule, college students do not pack their belongings into the back of a minivan in early September wondering *if* they will get a diploma—only *when*.

Yet, far too often, that initial confidence is misplaced. Six years after the first class of the new millennium left for college, many of those same students were absent from commencement ceremonies and would never stroll across the graduation stage—not because they had already finished by the spring of 2007 but because they were still struggling to earn enough credits, or they had dropped out of college altogether, or they had transferred and were lost according to the way we count graduation rates.

In a time when college degrees are valuable—when employers pay a premium to college graduates and when growing unemployment disproportionately affects workers without a degree—on average, four-year colleges graduate fewer than 60 percent of their freshmen within six years. At many institutions, graduation rates are far worse.

There are famous, perhaps apocryphal, stories of deans addressing incoming classes in the nation's best universities, in which students are told to look to the left of them and then to the right. The punch line is that one of those people will not be there at graduation time. As our analysis of graduation rates shows, at the nation's top universities, this is not the case—almost everyone sitting in the welcoming ceremony will graduate. In some institutions, however, the dean could say, “Look to the right of you, look to the left, look in front of you, look in back of you, look any which way you want, because almost no one you see, including you, will graduate from here.”

The University of Louisville, for example, which enrolls over seventeen thousand undergraduates, has a 44 percent six-year graduation rate. At the University of Memphis, the rate is 34 percent. The University of Alaska, Fairbanks, graduates only 25 percent of students within six years. Graduation rates below 50, 40, and even 30 percent are distressingly easy to find, even when the measure is the percentage of students graduating within *six years*.

In his first speech to Congress in late February, President Obama emphasized that low graduation rates are a threat to America's international competitiveness and challenged the nation's colleges and universities to improve. “By 2020,” he promised, “America will once again have the highest proportion of college graduates in the world.” Weeks later, the president's first budget proposal included an unprecedented \$2.5 billion in new funding to increase college completion. The administration recognizes the urgent need to tackle the graduation crisis, but the depth and breadth of that crisis are breathtaking.

When confronted with rock-bottom graduation numbers, many colleges point to their academic mission or blame students as culprits, citing poor high school preparation and the need to enroll a diverse array of undergraduates, not all of whom are equally ready to succeed. It is certainly true that graduation rates should be considered in context. Harvard's 97 percent four-year graduation rate may not be all that impressive—it is easy to grant diplomas when you enroll only students who are most likely to succeed.

But a closer analysis of graduation rates reveals wide variance among institutions that have similar admissions standards and admit students *with similar track records and test scores*.¹

Using official graduation rates submitted to the U.S. Department of Education, this report identifies the top and bottom performers among institutions that have similar levels of admissions selectivity, as reported in the widely used *Barron's Profiles of American Colleges*.² We show that within each category of selectivity, there are large differences between the schools that graduate most students and those that graduate few. While student motivation, intent, and ability matter greatly, our analysis suggests that the practices of higher education institutions matter, too.

Colleges also point to the limitations of the graduation rate measure; some students graduate after more than six years, and some graduate after transferring. This is true, but these limitations apply to all colleges within each selectivity group, usually (although not always³) depressing graduation rates in a similar way. When two colleges that enroll similar students have a graduation rate gap of twenty or thirty percentage points or more, it is fair to ask why. More important, students, parents, guidance counselors, and taxpayers (who foot the bill for many student costs) all deserve to know which schools graduate most of their students and which graduate only a few.

The institutions covered in this report run the gamut from large, public research universities to small, private liberal arts colleges; from highly selective, world-famous institutions to regional, open admissions ones. America's college graduation rate crisis is not happening at the handful of institutions that admit only a few of their applicants and graduate most—it is happening at a large swath of institutions that admit many but graduate few. Colleges that can pick and choose among applicants nearly always have the highest graduation rates. Among less selective institutions, by contrast, the differences in graduation rates are often large. John Carroll University in Cleveland, Ohio, admits 86 percent of applicants and graduates 74 percent within six years. Chicago State University admits a smaller percentage of applicants (57 percent) but graduates only 16 percent. Of course, the large majority of college students enroll at less selective institutions.

A host of factors beyond selectivity affect graduation rates—funding levels, institutional mission,

student demographics, and other factors play a part. This complexity is precisely why outcomes-based analyses of college success are so important.

For too long, institutional status has been driven by a combination of inputs and long-established, vaguely grounded academic reputations. Colleges that spend (and charge) the most money and enroll high-quality students are assumed to be exemplary. Everyone just “knows” that these institutions are first-rate. This not only deprives many other institutions from being recognized for their successes; it also gives far too many colleges and universities a free pass on being held accountable for the extent to which their students learn and earn degrees.

We are not suggesting that high graduation rates are invariably a good sign or low graduation rates necessarily a bad one. After all, an easy way to pad graduation rates is to drop standards and hand a diploma to every student who walks through the door. The high graduation rates at Harvard, Notre Dame, Princeton, or Stanford may not say as much about those institutions as they do about the students who attend them. The results reported here should be read with such cautions. In particular, we do not want to suggest that modest differences in graduation rates should be overemphasized—that is why we focus on the extremes.

We believe that the graduation rate measure included here should be just the beginning of a deeper inquiry into college success—one driven by more accurate measures broadly defined: in future earnings, in acquiring knowledge, in succeeding in the workplace, and ultimately in becoming the kind of citizens on which the stability and prosperity of our society rest. Colleges play a large role in shaping those outcomes, for good or ill—more so, perhaps, than is often believed.

Methods

We want to repeat our cautionary note: colleges and universities have many goals and serve a wide range of populations. Most students, however, attend college to earn a degree—and every institution in this

analysis is recognized as a bachelor's degree-granting school. While more holistic measures or value-added metrics may be desirable, any set of indicators must include a measure of graduation rates.

In our analysis, we use the most widely known and, indeed, legislatively defined graduation rate. In 1990, reflecting a growing interest in student outcomes, Congress passed the Student Right-to-Know (SRK) and Campus Security Act (Public Law 101-542) as an amendment to the reauthorization of the 1965 Higher Education Act. The SRK law requires that all colleges report graduation rates to the National Center for Education Statistics (NCES) for their students to receive federal financial aid.⁴ The SRK graduation rate is defined as the percentage of that cohort of full-time beginning students that graduate in 150 percent of the "expected" time that it should take to complete a degree. For a bachelor's degree, which traditionally has taken four years, the SRK graduation rate is therefore based on graduation within six years.

Because it does not include students who do not fit the definition of full-time, first-time, degree-seeking students, this official graduation rate covers only about a quarter of full-time students enrolled in American higher education. It is also an "institutional graduation rate" rather than a "total" graduation rate. This is because students who do not graduate from the school at which they started may eventually graduate from another college or university. The *Beginning Postsecondary Students Longitudinal Study: 1996–2001*, conducted by NCES, shows that many students switch institutions and then graduate, often taking longer than the six-year cutoff. This survey suggests that the "individual graduation rate" is about 8 percent higher than the average institutional graduation rate.⁵

Despite its limitations, the SRK graduation rate is *the only common metric available* for comparing graduation rates across the nation's array of institutions of higher learning. Moreover, this measurement reflects a fundamentally important aspect of institutional performance.

Given the diversity in the qualifications and backgrounds of students admitted to different types of colleges and universities, it would be unfair to

compare the graduation rates of the most selective schools in the nation with open admissions schools, at which many students have to meet a complex set of financial and academic challenges that can interfere with their educational progress. In our analysis, we use the well-known *Barron's* selectivity index to divide colleges and universities into six levels of selectivity, recognizing the differences in the types of students who attend various institutions.

Most of the data we report come from official government statistics available through the Integrated Postsecondary Education Data System (IPEDS) housed at NCES.⁶ The most recent graduation data in IPEDS are from the 2001 entering class. The SRK graduation rate for that class is calculated six years later and reported in the 2007 IPEDS. In that year, there were over 2,000 colleges and universities that were identified as granting bachelor's degrees. Of these, 1,853 reported graduation rates for the incoming class of 2001.⁷ The other data we report, such as admissions rates, tuition, and Carnegie classification (bachelor's, master's associates, research, special, etc.), are also drawn from the 2007 IPEDS.

To account for differences in the selectivity of colleges and universities, we used *Barron's* selectivity rankings. Specifically, we coded schools into six categories based on their selectivity as reported by *Barron's*. Of the 1,853 institutions with graduation rate data from IPEDS, 1,385 were ranked in *Barron's*—and this is the set of schools we used.⁸ Because families are making school selections during the 2008–2009 academic year, we used the most recent selectivity data.

In classifying schools, *Barron's* takes into account a variety of factors: SAT/ACT scores, the percentages of 2007–2008 freshmen who ranked in the upper one-fifth and upper two-fifths of their high school graduating classes, the minimum class rank and grade point average required for admission (if any), and the percentage of applicants to the 2007–2008 freshman class who were accepted. The six *Barron's* selectivity categories, which we used as a basis for comparing similar institutions, are as follows:

- “Noncompetitive” colleges generally require only evidence of graduation from an accredited high school (although they may also require completion of a certain number of high school units).
- “Less competitive” colleges have median freshman test scores that are generally below 500 on the SAT and below 21 on the ACT; require entrance examinations but do not report median scores; admit students with average high school grades below C who rank in the top 65 percent of their graduating class; and usually admit 85 percent or more of their applicants.
- “Competitive” colleges generally have median freshman test scores between 500 and 572 on the SAT and between 21 and 23 on the ACT; require minimum high school grades that range from C to B–; admit students in the top 50–65 percent of their high school graduating class; and accept between 75 and 85 percent of their applicants.
- “Very competitive” colleges typically admit students with high school grade averages no lower than B– and who rank in the top 35–50 percent of their graduating class; have median freshman test scores ranging from 573 to 619 on the SAT and from 24 to 26 on the ACT; and admit between one-half and three-quarters of their applicants.
- “Highly competitive” colleges generally admit students with high school grade averages of B to B+ and accept most students from the top 20–35 percent of their high school class; have median freshman test scores ranging from 620 to 654 on the SAT and 27 or 28 on the ACT; and accept between one-third and one-half of their applicants.
- “Most competitive” colleges usually require high school rank in the top 10–20 percent and high school grade averages of B+ to A; have median freshman test scores between 655 and 800 on the SAT and 29 on the ACT; and typically admit fewer than one-third of applicants.

While America’s most competitive and highly competitive institutions often dominate popular discussions about quality, the vast majority of the nation’s colleges and universities are less selective, and most students attend these schools. As figure 1 shows, just under 14 percent of the institutions in our IPEDS sample are found in the top two selectivity categories. More than 45 percent of institutions in our sample are competitive, accepting more than three-quarters of applicants, and approximately two-thirds are in the bottom three categories. Institutions in the two most competitive categories enroll 21 percent of four-year students, while those that accept more than half of their applicants enroll the remaining 79 percent of all full-time students at four-year colleges and universities. The appeal of most institutions is rooted less in boutique academic programs or nationally renowned scholarship but in the promise that graduates will earn a diploma that will benefit them professionally and financially.

A Note on Transfers

Before moving on to the general findings, we should discuss transfer rates and the potential problems they pose for an analysis of graduation rates. Under government rules, students who transfer from their first institution and graduate elsewhere are counted as nongraduates by the first institution. For institutions that have a mission to provide transfer opportunities, this can significantly depress graduation rates. NCES does allow such institutions to report the percentage of students who transfer. Only 491 of the 1,385 institutions analyzed here did so, however, and many reported relatively few transfer students.

Not surprisingly, transfers are most frequent among schools in the least competitive categories. For those institutions that fall in the bottom three selectivity categories, the average transfer rate ranges from 24 percent (competitive) to 29 percent (noncompetitive). For schools in the three highest selectivity categories, the average rate drops from 20 percent for very competitive institutions to 17 percent for highly competitive ones and 7 percent for the most competitive ones.

These differences mirror the decline in graduation rates as you move down in selectivity, but what about differences in transfer rates *within* selectivity categories? The correlation between transfer rates and graduation rates is modestly negative, suggesting that higher transfer rates depress graduation rates; however, the relationship is relatively weak within the four lowest selectivity categories and is weakest among the least selective schools, where transfers are most prevalent. The correlation ranges from -0.23 (competitive) to -0.4 (noncompetitive) across the bottom four selectivity categories. In contrast, among the highly competitive and most competitive schools, the correlation is -0.7 . Transfers are infrequent across these schools, though, and they also have consistently high graduation rates. In general, differences in the relationship between transfer and graduation rates of schools within the same selectivity category are not especially large.

Table A3 in the appendix summarizes the dearth of transfer data and how transfer rates differ across institutions within the same category that have the

FIGURE 1
PERCENTAGE OF SCHOOLS AND ENROLLED STUDENTS
BY SELECTIVITY CATEGORY

SOURCE: Authors' calculations.

highest and lowest graduation rates. Almost half of noncompetitive schools report transfer data, but in the other categories, only about one-third of schools do. In general, reported transfer rates are not wildly different across schools within the same category that are ranked in the bottom and top thirds of the graduation rate distribution. These differences in transfer rates between the top and bottom schools in each selectivity category are typically about five to ten percentage points. The obvious outlier is the highly competitive category, in which the disparity between the top and bottom thirds is large, but this gap is based on a small number of schools.

These data, we believe, suggest that transfers can account for only a small portion of the difference between schools with the best and worst graduation rates in a given selectivity category. Transfers are a complicating factor, but their impact ought not to be exaggerated.

National Findings

The following discussion reviews the institutions with the highest and lowest official graduation rates and reveals the large differences that exist among these schools for each of the six *Barron's* classifications. These comparisons make clear the gulf in graduation rates even among institutions that accept students with similar academic credentials.

Because the vast majority of students and families weighing college decisions are focused on geographically proximate institutions, we also cluster institutions by region in reporting graduation rates (as defined by *U.S. News & World Report*).⁹ Below, readers will also find institutions with the top and bottom graduation rates for each of the *Barron's* categories reported within four broad regions: the North, South, Midwest, and West. We then discuss graduation rates for Historically Black Colleges and Universities (HBCUs) and for Institutions of High Hispanic Enrollment (IHHEs)¹⁰ (see table A4 in the appendix for full results).

Figure 2 presents the average graduation rates for institutions grouped by selectivity and the range in graduation rates (the vertical lines) for each category. It shows that graduation rates increase with competitiveness: open admissions institutions graduate the lowest percentage of students, and highly selective colleges and universities graduate the highest. This has to do as much with the student bodies at these institutions as with their academic programs, and it illustrates why it is essential to focus on apples-to-apples comparisons. In addition, the figure reveals that the gaps between the highest and lowest graduation rates in a category are large for the bottom four selectivity categories and that these ranges shrink as you move up in selectivity. These data suggest that even schools within the same selectivity category can have drastically different

records of success and that this is especially true for those institutions that serve the majority of the nation's students.

Noncompetitive institutions graduate, on average, 35 percent of their students, while the most competitive institutions graduate 88 percent. Less competitive and competitive schools do better than noncompetitive institutions, but the average graduation rate in these categories is less than 50 percent. There is considerable improvement as we move from the competitive to the very competitive categories, with very competitive institutions graduating 62 percent of their students. Highly competitive schools graduate 75 percent of their students, a graduation rate that lags behind that of most competitive schools.

Perhaps more important—and certainly more relevant for students and families—are the differences in graduation rates among schools *within* the same selectivity categories. This is especially true for noncompetitive and less competitive institutions. Take, for instance, Heritage University and Walla Walla University, both in Washington. On the surface, the schools look similar—both are noncompetitive, private master's degree-granting colleges located in the same state. However, Walla Walla graduates 53 percent of its students, while Heritage graduates only 17 percent. Our analysis reveals that such substantial differences between similar schools are quite common.

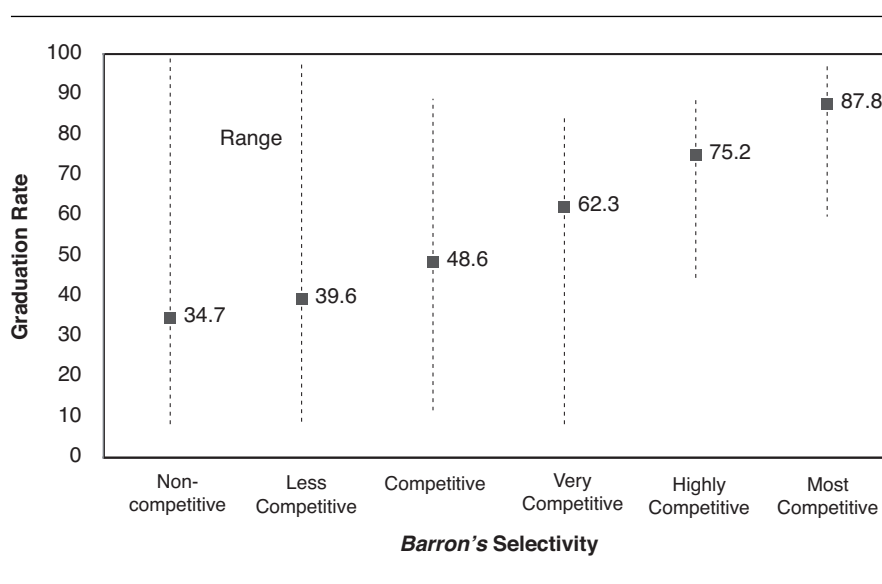

To illustrate the differences within selectivity categories, we sorted the schools according to their graduation rates and then ranked the top and bottom ten institutions in each category (see table 2 beginning on page 10). To illustrate that the variation in graduation rates is not simply a function of outliers in the bottom and top ten, we then examined the average graduation rate for schools in the

top and bottom thirds of the rankings for each category (see table 1).

In the noncompetitive category, the range in graduation rates spans ninety-two percentage points, from Southern University, New Orleans, at 8 percent to Arkansas Baptist College at 100 percent. As table 1 shows, noncompetitive schools ranked in the bottom third have an average graduation rate of just 20 percent, with institutions like Southern University, New Orleans; Carlos Albizu University, Miami; and American Intercontinental University in Georgia failing to graduate

over 85 percent of their students. In contrast, the twenty-six noncompetitive schools in the top third have an average graduation rate of 52 percent. In other words, the difference between an average school from the high graduation pool and one from the low graduation pool is thirty-two percentage points—students who attend schools in the top third are more than twice as likely to earn a diploma

FIGURE 2
AVERAGE SIX-YEAR GRADUATION RATE AND RANGE
BY SELECTIVITY CATEGORY

SOURCE: Authors' calculations.

within six years than students enrolled in the bottom third. Institutions like Thomas University in Georgia (70 percent), Concordia College in Alabama (97 percent), and Arkansas Baptist (100 percent) are excelling relative to many of their peer institutions.

In the less competitive category, the range in graduation rates spans eighty-nine percentage
(continued on page 16)

(continued from page 9)

points, from Edward Waters College at 9 percent to Atlantic Union College at 98 percent. The sixty-two schools ranked in the bottom third had an average graduation rate of 26 percent, and none of the bottom ten institutions graduate more than 20 percent of their students in six years. Meanwhile, the sixty-two schools in the top third graduate an average of 54 percent of their students. Institutions like Paul Quinn College in Texas and Atlantic Union in Massachusetts graduate more than 90 percent of their students, while other less competitive schools like South University in Georgia and National-Louis in Illinois do not surpass the 15 percent mark.

The largest number of colleges and universities in the United States fall under the competitive category. Graduation rates at competitive institutions spanned seventy-seven percentage points, ranging from 12 percent (Voorhees College in South Carolina and Texas Southern University) to 89 percent (College of Our Lady of the Elms in Massachusetts). The 220 schools in the bottom third have an average graduation rate of 35 percent. Within the bottom ten schools, six institutions graduate fewer than one in five of their students in six years. In contrast, the top 220 institutions in the category graduate about 62 percent of their students. Though the students enrolling in Our Lady of the Elms and Texas Southern may be similar academically, their choice of college may significantly affect their chances of obtaining a degree.

The highest- and lowest-ranked very competitive institutions have graduation rates that are also seventy-six percentage points apart. Edward Waters College in Florida graduates only 9 percent of its students, while the graduation rate of Stonehill College in Massachusetts is ten times higher (85 percent). Even at the very competitive level, the ninety-two schools in the bottom third fail to graduate more than 50 percent of their students on average. Meanwhile, the ninety-two institutions in the top third graduated 74 percent of their students, with Stonehill and Pennsylvania State University leading the way.

Among the nation's highly competitive schools, variation still exists. The range in graduation rates is

forty-five percentage points, but the gap between the top and bottom thirds shrinks to nineteen percentage points. However, almost all schools with the ten lowest graduation rates fail to graduate more than 60 percent of their students. New York's New School is the only institution in the bottom ten to pass the 60 percent mark, while the New Mexico Institute of Mining and Technology anchors the bottom with a 44 percent graduation rate. Two flagship state universities—University of Michigan, Ann Arbor, and University of California, Berkeley—appear to do an exemplary job with their large and diverse student bodies, with graduation rates of 88 percent. Their record is similar to smaller liberal arts colleges like Trinity College in Connecticut (87 percent) and Grinnell College in Iowa (87 percent).

Institutions in the most competitive category enroll the nation's most talented students, and their graduation rates are consistently over 60 percent. In the top ten, no school falls below a 90 percent graduation rate. Apart from these colleges and universities, however, the national picture reveals substantial variation in graduation rates across institutions with similar admissions criteria.

In ranking over one thousand institutions, there are inevitably outliers where legitimate factors fuel noticeably low or high graduation rates. For instance, several engineering institutions—such as Embry Riddle in Florida, with a graduation rate of 61 percent—have more modest rates than comparable schools, likely due to a more demanding curriculum. Furthermore, Goddard College, whose 50 percent graduation rate looks at first glance like a risky investment for a prospective student, is explicitly geared toward adults with transfer credits. Given Goddard's niche and mission, the SRK graduation rate based on first-time, full-time beginning students who graduate within six years applies to few of its students, meaning the figures may be of little or no use in gauging its performance. The point, which bears frequent repeating, is that the data reported here are invaluable to students, families, and policymakers, but they still need to be read sensibly and used with care.

Regional Findings

Proximity to home is an important consideration for prospective college students, the majority of whom will choose to remain within driving distance of their hometown. In 2005, 56 percent of college freshmen attended a school within one hundred miles of their home.¹¹ Given the importance of proximity, we compare graduation rates of schools within similar geographic regions. Table A4 in the appendix displays the top and bottom five schools in each selectivity category within each region.

Northeast. The Northeast houses many of the nation's best institutions, and the distribution of graduation rates in this region reflects the high quality of many of these schools. The stellar performance of schools like Harvard, Amherst, and Yale, however, whose average graduation rates are better than 95 percent, should not obscure the poor performance of many other institutions. Among noncompetitive and less competitive schools, graduation rates like the University of the District of Columbia's 19 percent, tied for the lowest in the region, are far too common.

Several colleges and universities in the Northeast fare better in graduating their students than one might expect given their low selectivity. Merrimack College in Massachusetts, for instance, a competitive school, has a graduation rate of 78 percent, followed closely in the same category by Westminster College in Pennsylvania at 76 percent. On the flip side, given their relatively selective admissions criteria, a few schools fare worse than might be expected. Touro College and the College of New Rochelle, both in New York, are rated very competitive, but their graduation rates are just 25 percent and 37 percent, respectively.

There is wide variation in regional graduation rates within the less competitive (seventy-nine percentage points), competitive (seventy percentage

points), and very competitive (sixty percentage points) selectivity categories. These ranges shrink to thirty-two percentage points among highly competitive schools and thirty-seven percentage points among most competitive ones. Even at the most selective levels, however, private schools like Bennington College in Vermont or the New School in New York graduate only about 60 percent of their students. Meanwhile, Mount Holyoke College and Babson College, both in Massachusetts, accept the same type of students and charge about the same tuition but graduate about 30 percent more of their students than these other institutions.

Midwest. As with other regions, the range in graduation rates for schools in the Midwest varies widely across and within selectivity categories. Among non-competitive schools, the range is forty-three percentage points, with a low of 15 percent at the National American University, Rapid City, in South Dakota and a high of 58 percent at Kansas State University. The overall gap between the top and bottom performers is even larger among less competitive schools (seventy-one percentage points), where National-Louis University in Illinois boasts the lowest graduation rate in the region (12 percent) and Cleary University in Michigan one of the highest (83 percent).

The gaps between the top and bottom graduation rates get smaller as we move up the selectivity scale, from sixty percentage points (competitive) to fifty-one percentage points (very competitive) to thirty-six percentage points (highly competitive). Even in the competitive and very competitive levels, though, not one school in the bottom five graduates more than 50 percent of its students. Some institutions, like Northeastern Illinois University or Central State University in Ohio, leave about 80 percent of their

students without degrees after six years. The news for the most competitive schools is brighter; the range in this category is only fourteen percentage points, with Case Western Reserve University at the bottom with an 81 percent graduation rate and the University of Notre Dame at the top with a 95 percent graduation rate.

South. The South has the dubious distinction of housing institutions with some of the lowest graduation rates in our sample. At the noncompetitive level, none of the five institutions with the lowest graduation rates in the region surpass 20 percent. At the less competitive level, schools like South University in Georgia and Edward Waters College in Florida graduate well under 15 percent of their students. Overall, of the seventy-eight schools in the South classified as noncompetitive or less competitive, only six (less than 8 percent) have graduation rates higher than 50 percent. In contrast, not one of the twenty-nine schools rated highly competitive or most competitive failed to graduate half of their first-time students.

There is considerable variation within selectivity categories as well. The gaps between the top and bottom graduation rates within the lowest selectivity categories are large: ninety-two percentage points for noncompetitive and forty-three percentage points for less competitive schools. Meanwhile, with the exception of the less competitive category, the range between the highest and lowest performers shrinks with each step up the selectivity scale, and it falls to just eighteen percentage points among the most competitive schools.

In the South, it is again relatively easy to find schools that look similar in most respects but that

have significant disparities in graduation rates. The University of Louisville in Kentucky is a very competitive public research university that enrolls around seventeen thousand students and charges about \$7,000 in tuition. It graduates only 44 percent of its students. In contrast, James Madison University in Virginia, another public university that enrolls about seventeen thousand students and charges slightly less than \$7,000, graduates 81 percent of its students.

West. The patterns for institutions in the West are largely consistent with those of the other regions. Of the sixty-six colleges and universities denoted noncompetitive and less competitive, only 9 percent have graduation rates over 50 percent, including a regional low of 10 percent at Jarvis Christian College in Texas. Meanwhile, at the top of the selectivity scale, of the forty western schools in the highly competitive and most competitive categories, all but one have graduation rates above this threshold, led by Stanford University at 95 percent.

Again, though, even among institutions of the same selectivity—and those that enroll highly qualified student bodies—it is easy to find gaps in the rates at which students graduate. The University of Colorado, Boulder, for instance, is a public research university designated very competitive that charges just over \$6,600 for in-state tuition and graduates 67 percent of its students. The University of Colorado at Colorado Springs, a rival state school, is a public master's degree-granting university also ranked very competitive that charges slightly less for in-state tuition, at \$5,700. Its graduation rate, however, is substantially lower at 41 percent.

Historically Black Colleges and Universities/ Institutions of High Hispanic Enrollment

Historically Black Colleges and Universities

HBCUs occupy an important place in American higher education, having played a prominent role in educating African Americans who were historically excluded from other colleges and universities. While HBCUs represent just 3 percent of the nation's institutions of higher learning, they graduate nearly 20 percent of African Americans who earn undergraduate degrees and more than 50 percent of African American professionals. Despite their importance, the seventy-eight HBCUs featured in this report are failing to graduate a large percentage of their student body.¹²

Among HBCUs, there are a few well-known institutions that compete for top talent, such as Howard University and the all-women Spelman College, which post graduation rates of 69 percent and 78 percent, respectively. However, 97 percent of HBCUs fall into the noncompetitive, less competitive, or competitive categories, and the graduation rates at sixty-seven of these seventy-eight institutions fall below 50 percent.

There are some success stories. Arkansas Baptist University and Concordia College in Alabama, both noncompetitive HBCUs, graduate 100 percent and 97 percent of their students, respectively. Paul Quinn College in Texas, a less competitive school, graduates 93 percent of its students, outperforming its closest comparable competitor by forty-two percentage points. On the whole, however, HBCU graduation rates are low, especially compared to other non-HBCU schools of similar characteristics.

HBCUs typically charge substantially lower tuition rates than non-HBCUs. Arkansas Baptist College, for instance, charges tuition of just under \$5,500 and has the highest graduation rate in the

nation. Still, there are a number of HBCUs that charge relatively high tuition matched by low graduation rates. Saint Paul's College in Virginia, a non-competitive school with tuition of more than \$12,000, graduates just 25 percent of its students. Similarly, Stillman College in Alabama, a less competitive school with tuition of more than \$12,000, has a graduation rate of only 23 percent.

HBCUs play an important role in our higher education system, and some appear to be doing an excellent job of providing opportunities to their students by helping them earn a degree in a reasonable amount of time. For many African American men and women, however, choosing to attend an HBCU may be a risky investment, one with a less than 50 percent chance of producing a degree.

Institutions of High Hispanic Enrollment

IHHEs—schools with undergraduate student bodies comprising at least 25 percent Hispanic students—tend to be located in states with large Hispanic populations, such as California, Texas, Florida, and New Mexico. Overall, the fifty-two IHHEs included in this report are less selective and have lower graduation rates than non-IHHEs, with roughly 96 percent ranking in the bottom three selectivity categories. Of these, 78 percent have graduation rates under 50 percent. None of the schools under the IHHE classification have a graduation rate that is higher than 60 percent.

Although IHHEs generally have more modest graduation rates, there is significant variance among schools in the same category—but the pattern is different than previously seen. The range is largest in the competitive category (with graduation rates of 19–59 percent), slightly smaller for the less

TABLE 3
**AVERAGE SIX-YEAR GRADUATION RATE AND RANGE OF HISTORICALLY BLACK COLLEGES
 AND UNIVERSITIES AND INSTITUTIONS OF HIGH HISPANIC ENROLLMENT BY SELECTIVITY CATEGORY**

	—————HBCUs—————		—————IHHEs—————	
	Graduation Rate	Percent Range	Graduation Rate	Percent Range
Noncompetitive	37.1%	8–100	19.8%	10–29
Number of schools in sample	11		6	
Less Competitive	34.7%	9–93	36.9%	19–49
Number of schools in sample	32		14	
Competitive	36.5%	12–69	44.3%	19–59
Number of schools in sample	33		30	

competitive category (19–49 percent), and smallest for the noncompetitive category (10–29 percent). As these ranges reveal, students in search of an IHHE that suits their needs must confront stark differences in completion rates. For instance, California students looking for an IHHE in the competitive category have a choice between California State University (CSU), Stanislaus, which charges about \$3,300 in tuition and graduates 52 percent of its students, and CSU, Los Angeles, which charges about the same tuition but graduates only 31 percent. Unfortunately

for Hispanic students in search of a noncompetitive option, all of the IHHE schools in this category are doing a lackluster job, graduating less than 30 percent of their first-time students in six years.

Both of these types of institutions cater to minority students and are arguably more sensitive to the needs and challenges of these students. The graduation rate data show that, far from outperforming other schools, HBCUs and IHHEs lag behind national averages, particularly at the lower levels of selectivity.

Conclusion

This fall, well over one million students will enroll in four-year colleges. It is safe to say that nearly all of them expect to graduate. At some schools, and especially at the nation's elite institutions, the vast majority of students can reasonably plan on doing so. At far too many other colleges, however, students are likely unaware that they have less than a one in four chance of earning a degree by 2015, even as they spend thousands of dollars on tuition and countless hours working toward a degree they may never receive. Perhaps more tragically, tens of thousands of these students will enroll at institutions from which they are unlikely to graduate, even when there are less expensive alternatives nearby at which they would be far more likely to complete their degree.

Some students go to college seeking top-shelf music programs, world-renowned physics faculty, tiny seminars, eye-popping athletic facilities, and lush campus landscapes. These fortunate students search nationally for the right college and then compete feverishly to get into the small pool of elite institutions that can satisfy their needs. The top-performing prospective students are catered to by counselors, rating guides, and consultants who shower them with information and advice. This report is not intended for those students or focused on those elite institutions.

Most students search for institutions that are close to home, attend schools that accept most applicants, and are focused on getting their degree at an affordable price. For students at a vast majority of the more than 1,300 four-year colleges included in this study, the readily available data are of little help in deciding the most basic question: how confident can I be that I will graduate from a college or university?

This is not just a matter of importance for students and families. President Obama hopes to increase

dramatically the number of college-goers and is asking taxpayers to help foot the bill. If we are to adopt such a course, receiving good value on our investment requires that students receive quality instruction and earn degrees in a timely manner. At many institutions in line to benefit from billions of dollars in increased federal aid, it is hard to be confident that these conditions will be met.

As we have noted, six-year graduation rates depend on an institution's students and not just its academic program. The fact that incoming Ivy League students are much more likely to graduate than are students entering a regional institution has long afforded schools a justification as to why they cannot and should not be compared or held responsible for outcomes. We address this concern by comparing institutions with similar admissions criteria. This ensures that we are not lauding institutions simply for attracting academically successful students and graduating them at high rates.

At the same time, schools should not be unfairly penalized for maintaining high standards. One peril with tracking degree completion, just as with tracking high school graduation rates, is encouraging institutions to hand out diplomas like candy. We trust that readers will keep in mind, just as we do, that there is an array of factors—like institutional mission, resources, and approach—that affect graduation rates.

Policymakers should acknowledge these factors as they move to promote greater transparency and accountability built around graduation rates. We need to ensure that graduation rate measures reflect the diversity of America's student population, especially the growing number of transfer and part-time students. We also need to ensure that, as graduation rates become part of any accountability system, these factors are taken into account. Failing to do so

could create incentives for institutions to increase graduation rates by lowering academic standards.

With these problems in mind, the fact still remains that a crucial piece of information for students and families deciding whether and where to enroll is the likelihood of receiving a degree. The data reported here represent the only comparable metric available to measure graduation rates across the nation's two-thousand-plus bachelor's degree-granting colleges and universities. These data suffer from real limitations—they cover a declining proportion of all college students, they fail to track transfer students, and they do not account for the fact that some colleges do a better job imparting knowledge than others. Despite these limits, they are an invaluable piece of information that should be readily available to families.¹³

These data present a disconcerting picture. Even as President Obama seeks to return the nation to its historical position as the international leader in post-secondary degree completion by 2020, hundreds of institutions are failing to graduate a majority of their students in six years. Colleges and universities receive tens of billions of dollars from taxpayers every year, but the evidence suggests that many of these institutions are not serving their students well. In a time of fiscal constraints and tight budgets, voters and public officials should be made aware of which institutions are not accomplishing their most basic mission.

Parents, prospective students, and guidance counselors should take a hard look at graduation rates. If the numbers are low, they should make sure there is a good reason. If none is forthcoming, they should look for alternative places to invest their time, their money, and their future.

Legislators and higher education officials should regularly examine the graduation rates of the institutions in their state. Where the results indicate grounds for concern, they should take a closer look and consider appropriate interventions, if warranted. Where institutions are doing well, officials may want to contemplate ways to direct more resources or students to those institutions.

It is possible that many of the nation's college-bound students are not college-ready—and that explains low graduation rates; however, if this is the case, we need to determine what needs to be done to prepare them for the rigors of college attendance and completion. For those who do choose to enroll in college, they should have crucial performance information readily at their disposal when making a choice. The bottom line is that students enrolling in a college or university should have a reasonable expectation that they will earn a degree in a timely fashion. Where they do not, we must confront challenges more profound than a simple need for more transparency.

Appendix

Sample Construction

The 2007 installment of IPEDS identifies over 2,000 colleges and universities that grant bachelor's degrees. Of these, 1,853 reported the six-year graduation rate (SRK) for the incoming 2001 cohort of students.

To be included in our analysis, a school had to be ranked in one of *Barron's* six selectivity categories. This eliminates many special focus schools like theological seminaries, art schools, and some institutions that specialize in training for a particular industry, which are listed in *Barron's* but are not ranked. *Barron's* does rank other special focus schools that focus on engineering or business and management. These types of schools are included.

In addition, although some schools have multiple campuses, each campus is not always ranked individually by *Barron's*. This is especially true for many for-profit institutions, like the University of Phoenix or National American University, and for some state universities like the SUNY system. In such cases, we included only the campuses that were ranked

individually by *Barron's*. For instance, while National American University operates campuses in Albuquerque, New Mexico; Independence, Missouri; Rapid City, South Dakota; and many other locations, *Barron's* ranked only the Rapid City campus, so this was the institution that we included. Of the 1,853 schools that award bachelor's degrees and reported graduation rates, 1,385 fulfilled our criteria.

It is important to note that the data used for this report cover a limited percentage of the total number of currently enrolled college students. In the fall of 2006, for instance, the number of full-time, first-time, degree-seeking undergraduates (those included in the graduation rate survey) was 2.4 million. Meanwhile, the total number of full-time undergraduates was about 9.9 million. In tables A4 and A5, all tuition amounts for public universities are reported as in-state tuition.

Data on selectivity categories from *Barron's Profiles of American Colleges 2009* reprinted with permission of *Barron's Educational Series*.

A1

DISTRIBUTION OF INSTITUTIONS AND STUDENTS BY SELECTIVITY CATEGORY

Selectivity Category	Institutions	Percentage	Students	Percentage
Noncompetitive	78	5.6	325,332	4.0
Less Competitive	185	13.4	713,321	8.8
Competitive	660	47.7	3,372,603	41.5
Very Competitive	274	19.8	2,025,954	24.9
Highly Competitive	107	7.7	1,050,497	12.9
Most Competitive	81	5.8	641,852	7.9
Total	1,385		8,129,559	

A2

AVERAGE SIX-YEAR GRADUATION RATE AND RANGE BY SELECTIVITY CATEGORY

Selectivity Category	Average Graduation Rate (%)	Low	High	Range
Noncompetitive	34.7	8	100	92
Less Competitive	39.6	9	98	89
Competitive	48.6	12	89	77
Very Competitive	62.4	8	85	77
Highly Competitive	75.2	44	89	45
Most Competitive	87.8	60	97	37

A3

TRANSFER RATE SUMMARY BY SELECTIVITY CATEGORY

Selectivity Category	Schools Reporting	Transfer Rate: Bottom Third	Transfer Rate: Top Third	Difference
Noncompetitive	37/78 (47%)	34.2	23.4	10.8
Less Competitive	59/185 (32%)	27.7	23.4	4.3

State Average	57.0				

Notes

1. Other recent studies have examined individual-level graduation rates. See J. Bound, M. Lovenheim, and S. Turner, “Understanding the Decrease in College Graduation Rates and the Increased Time to the Baccalaureate Degree” (Research Report No. 07-626, Population Studies Center, University of Michigan, 2007); and C. Adelman, *The Toolbox Revisited: Paths to Degree Completion from High School through College* (Washington, DC: U.S. Department of Education, 2006). For a review of the evidence on college completion, see S. Godrick-Rab and J. Roksa, *A Federal Agenda for Promoting Student Success and Degree Completion* (Washington, DC: Center for American Progress, 2008). Our analysis adds to this discussion by focusing on institutional graduation rates and explicitly comparing schools that have similar student bodies and admissions standards. A similar analysis by the National Center for Education Statistics (NCES) examined four-year graduation rates at colleges grouped into three broad selectivity categories. See Laura Horn and C. Dennis Carroll, *Placing Graduation Rates in Context: How 4-Year College Graduation Rates Vary With Selectivity and the Size of Low Income Enrollment* (Washington, DC: NCES, 2006).

2. *Barron’s Profiles of American Colleges* (Hauppauge, NY: Barron’s Education Series, 2009).

3. We discuss transfers in more detail on pages 6–7.

4. The data are reported through the Integrated Postsecondary Education Data System—widely known as IPEDS.

5. See U.S. Department of Education, National Center for Education Statistics, *Descriptive Summary of 1995–96 Beginning Postsecondary Students: Six Years Later* (Washington, DC: Department of Education, 2002), available at <http://nces.ed.gov/pubs2003/2003151.pdf> (accessed May 8, 2009).

6. U.S. Department of Education, National Center for Education Statistics, “Integrated Postsecondary Education

Data System,” available at <http://nces.ed.gov/ipeds/> (accessed May 8, 2009).

7. There are a variety of reasons the remaining schools, while having the authority to grant bachelor’s degrees, do not report a six-year graduation rate. For example, some are specialized religious schools; some are community colleges that have the authority to grant the degree but do not take in students who meet the definition for inclusion in the cohort.

8. For further description of the sample construction, see page 23.

9. We used the *U.S. News and World Report* regional definitions, which differ very slightly from those used by the U.S. government, to simplify matters for readers who wish to use the figures presented here in conjunction with that publication’s popular college guide.

10. Defined as institutions whose full-time equivalent enrollment of undergraduate students is at least 25 percent Hispanic, according to the fall 2005 enrollment IPEDS survey. See U.S. Department of Education, “Accredited Postsecondary Minority Institutions,” available at www.ed.gov/about/offices/list/ocr/edlite-minorityinst-list-hisp-tab.html (accessed May 8, 2009).

11. Higher Education Research Institute, *CIRP Freshman Survey 2005* (Los Angeles: University of California, Los Angeles, 2005).

12. A recent Associated Press study of graduation rates at HBCUs pointed out that some schools in this category have exceptionally low graduation rates, and rates of completion are especially low for African American men at HBCUs. Our results are similarly discouraging.

13. Last year, NCES unveiled a new website, the College Navigator, that made these data easier to access, but it has never published a compendium of scores such as this.

About the Authors

Kevin Carey is policy director at Education Sector. He writes a monthly column on higher education policy for *The Chronicle of Higher Education* and has published articles and op-eds in publications including *Washington Monthly*, *Phi Delta Kappan*, *Education Week*, *Washington Post*, *Los Angeles Times*, and *New York Daily News*. He has authored Education Sector reports on topics including college rankings and improving minority college graduation rates.

Frederick M. Hess is a resident scholar and the director of education policy studies at AEI. A former high school teacher and university professor, Hess is an executive editor of *Education Next* and a research associate at Harvard University's Program on Education Policy and Governance. His work has appeared in numerous academic and popular

publications, and his many books include *Tough Love for Schools*, *Common Sense School Reform*, and *Spinning Wheels*.

Andrew P. Kelly is a research fellow at AEI and a Ph.D. candidate in political science at the University of California, Berkeley.

Mark Schneider is a vice president for new education initiatives at the American Institutes for Research and a visiting scholar at AEI. Formerly the commissioner of the U.S. Department of Education's National Center for Education Statistics, Schneider is the author and coauthor of numerous scholarly books and articles, including the award-winning *Choosing Schools: Consumer Choice and the Quality of American Schools* (Princeton University Press, 2000).
